Low ON Resistance Nch Load Switch IC

NO.EA-319-190108

OUTLINE

The R5541K is a CMOS-based dual supply voltage load switch IC. The R5541K is an ideal switch for supplying the power from the secondary power source such as the output of a step-down DC/DC converter to the load circuit. A built-in Nch. transistor with typically 18 mΩ ON resistance allows the R5541K to provide a low dropout voltage and prevents the reverse current during shutdown mode. Internally, a single IC consists of an internal voltage step-up circuit, a soft-start circuit, a thermal shutdown circuit, a chip enable circuit and a UVLO circuit.

The gate voltage of Nch. driver transistor is supplied by a soft-start circuit. The soft-start circuit is supplied by the external power source (V_{BIAS}). Soft-start time is adjustable by connecting an external capacitor.

The R5541K is offered in an ultra-small 6-pin DFN(PLP)1216-6G package which achieve the smallest possible footprint solution on boards where area is limited.

SELECTION GUIDE

The auto-discharge function[1] is a user-selectable option.

Selection Guide

Product Name	Package	Quantity per Reel	Pb Free	Halogen Free
R5541K001∗-E2	DFN(PLP)1216-6G	5,000 pcs	Yes	Yes

∗: Specify the CE Pin Polarity and auto-discharge option.

    B: Active-High, no auto-discharge function
    D: Active-High, auto-discharge function

[1] Auto-discharge function quickly lowers the output voltage to 0 V, when the chip enable signal is switched from the active mode to the standby mode, by releasing the electrical charge accumulated in the external capacitor.

ABSOLUTE MAXIMUM RATINGS
Electronic and mechanical stress momentarily exceeded absolute maximum ratings may cause the permanent damages and may degrade the life time and safety for both device and system using the device in the field. The functional operation at or over these absolute maximum ratings is not assured.

RECOMMENDED OPERATING CONDITIONS   (ELECTRICAL CHARACTERISTICS)
All of electronic equipment should be designed that the mounted semiconductor devices operate within the recommended operating conditions. The semiconductor devices cannot operate normally over the recommended operating conditions, even if when they are used over such conditions by momentary electronic noise or surge. And the semiconductor devices may receive serious damage when they continue to operate over the recommended operating conditions.

TECHNICAL NOTES

The performance of a power source circuit using this device is highly dependent on a peripheral circuit. A peripheral component or the device mounted on PCB should not exceed a rated voltage, a rated current or a rated power. When designing a peripheral circuit, please be fully aware of the following points.

- An input capacitor (C_{IN}) and a bypass capacitor (C_{BIAS}) are NOT necessarily required between the V_{IN} pin and GND. If there is a possibility that the parasitic element (inductance) of V_{IN} may generate spike noise, connect an appropriate capacitor (about 0.1 µF) between the V_{IN} pin and GND.
- V_{IN} and V_{BIAS} should always be used as $V_{IN} \leq V_{BIAS}$.
- Connect the DELAY pin to a capacitor (C_D) or leave the DELAY pin floating.

RICOH

SOFT-START FUNCTION

Soft-start function maintains the smooth control of the output voltage to prevent an inrush current during start-up by adjusting the soft-start time (tstart) (V_{OUT} = 10% to 90%). tstart can be adjusted by connecting a capacitor (C_D) between the DELAY pin and GND. The calculation of C_D is as follows.

$$C_D \text{ [nF]} = 7.5 \times tstart \text{ [ms]} \times I_{DELAY} \text{ [µA]} / V_{IN} \text{ [V]}$$

If C_D is not connected to the DELAY pin, leave the DELAY pin floating. If the DELAY pin is left floating, the calculation of the start-up time (tr) (V_{OUT} = 10% to 90%) is as follows.

$$tr \text{ [ms]} = 0.04 \times V_{IN} \text{ [V] (Typ.)}$$

V_{BIAS}, V_{IN} and CE can be sequenced in any order; the device can start up with soft-start function.
