## Description

The MAAD-011049 is a wide band 4-bit, 2 dB step MMIC digital attenuator in a lead-free 3 mm, 20 lead surface mount laminate package. This device is ideally suited for use where high accuracy, very low power consumption, and low intermodulation products are required.

This attenuator is controlled with either a SPI compatible serial interface or a 4 bit parallel word. SEROUT is the SERIN delayed by 6 clock cycles which can be used in daisy-chain operation.

## Handling Procedures

Please observe the following precautions to avoid damage:

## Static Sensitivity

These electronic devices are sensitive to electrostatic discharge (ESD) and can be damaged by static electricity. Proper ESD control techniques should be used when handling these devices.

## Modes of Operation: Serial and Direct Parallel

### Serial Mode

The serial control interface (SERIN, CLK, LE, SEROUT) is compatible with the SPI protocol. SPI mode is activated when P/S is kept high. The 6-bit serial word must be loaded with the MSB first. After shifting in the 6 bit word, a rising edge on LE will set the attenuator to the desired state. While LE is high the CLK is masked to protect the data while implementing the change. SEROUT is SERIN delayed by 6 clock cycles.

When P/S is low, the serial control interface is disabled. When P/S is set high, pins 18, 19, & 20 have the LE, CLK, and SER IN functions, respectively.

In serial mode operation, the outputs will stay constant while LE is kept low.

### Direct Parallel Mode

The parallel mode is enabled when P/S is set low. In the direct parallel mode, the phase shifter is controlled by the parallel control inputs directly. When P/S is set low, pin 18 has the D2 functions.

### Mode Truth Table

P/S	LE	Mode
1	X	Serial
0	N/A	Direct Parallel

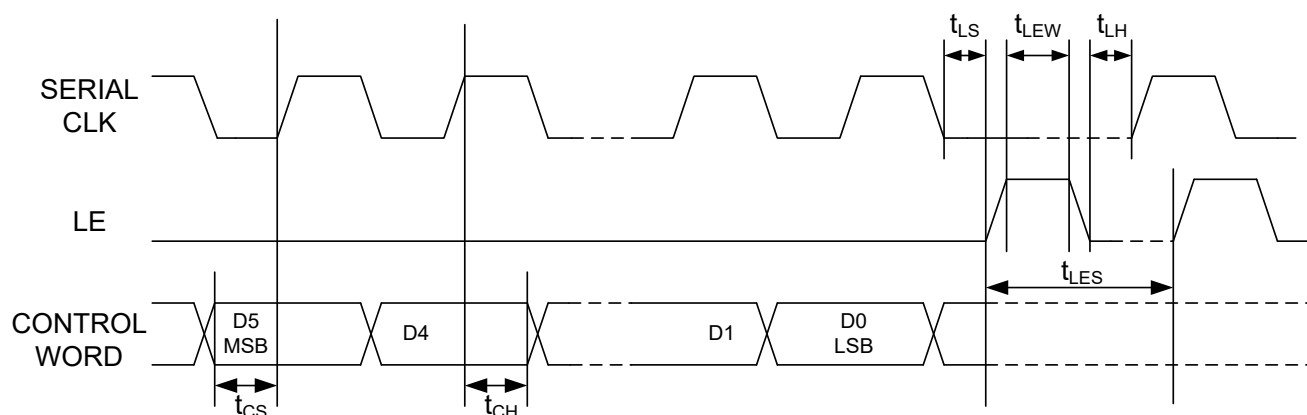

### Truth Table<sup>10</sup>
