

1 Description

The iW380 is a DC/DC step-down controller with tight current regulation and exceptional dimming performance for LED lighting. It is designed to be used in the high-side switching buck topology up to 78V input voltage and up to 98% of output voltage/input voltage ratio. With its advanced digital control, the iW380 offers Renesas' True DC Dimming from 100% down to 0.0625% with 0.0625% resolution and guaranteed linearity.

The iW380 features unique dual-dimming pins that significantly simplify application designs where multi-level maximum current settings are needed. The maximum LED current can be programmed through one dimming pin via the analog voltage level or an adjustable resistor. The other dimming port can be used for auto-detectable 3-in-1 dimming: analog voltage, PWM duty or resistor dimming. Internally, the iW380 processes the dimming inputs and regulates the output current percentage by DIM1% x DIM2%.

A dedicated light-off mode in the iW380 turns off the output current when the dimming signal input is less than the light-off threshold. In the light-off mode, the iW380 consumes minimum power while still monitoring the dimming inputs. If the dimming signal input becomes higher than the light-on threshold, the iW380 can immediately wake up and resume output current regulation.

The iW380 provides flexibility to optimize dimming resolution and dimming signal noise immunity. When a noisy analog dimming level or jittering PWM dimming duty is supplied to the iW380, the iW380 can keep the output current stable with some tradeoff to dimming resolution by configuration. Also, the iW380 has configurable minimum startup voltage. This feature can effectively prevent light flicker/flash at power off across different applications.
